

Using ArchSite's Subscription View

Accessing the Subscriber View Map

The Public View Map, whose cultural resource data layers include National Register Properties, Historic Buildings, and Historical Areas, is available without registering and without cost. The Subscriber level view provides data and support to state and local professionals who need access for planning and stewardship activities, such as OCRM permits. As the Subscriber View provides access to archaeological site data and restricted National Register properties in addition to the nonrestricted data layers available in the Public View, access to this view requires a vetting procedure to ensure that their request for access of site location data is appropriate. See the [Subscription Overview](#) page of the SC ArchSite website for more information about the the Subscriber level and for information on how to establish a subscriber account.

Once you have an account, enter your user name and password on the the SC ArchSite home page to log in.

The screenshot shows the SC ArchSite website home page. At the top, there is a dark navigation bar with the URL "scarchsite.org" and links for "Public View Map", "Subscriber Map", "Subscription Info", "Disclaimers", and "About". Below the navigation bar is the SC ArchSite logo, which includes the text "SC ArchSite SCIAA + SCDAH" and two small icons. The main content area is divided into two columns. The left column contains introductory text about the South Carolina Institute of Archaeology and Anthropology (SCIAA) and the South Carolina Department of Archives and History (SCDAH), and information about the ArchSite database. The right column features a login form for the Subscription View, which includes a "Go to Public View Map" button, a "Log In to Subscription View" section with "User Name:" and "Password:" fields, and a "Log In to Subscriber Map" button. A purple circle highlights the login form area. Below the login form, there is a "Welcome to the New ArchSite" message and a link for "Who needs to subscribe? Create an account I forgot my password".

SC ArchSite SCIAA + SCDAH

The **South Carolina Institute of Archaeology and Anthropology** (SCIAA) and the **South Carolina Department of Archives and History** (SCDAH) are pleased to offer ArchSite, an online cultural resource information system for the state of South Carolina. ArchSite combines data from the state's archaeological and built heritage to provide researchers with an online source for cultural resource information.

ArchSite includes two applications that have been designed for specific users: Public View and Subscription View. **Note:** *The previous version of ArchSite required all viewers to register and log in; the current version requires that only subscribers do so. Users of the Public View Map may go directly to the map.*

Access to the archaeological sites database is restricted to Federal, state, local, government and private historic preservation consultants for the purposes of preserving and protecting historic properties as defined by the National Historic Preservation Act, amended 2006. The exact location of historic properties owned by the Federal government and in this database are protected from public disclosure under the Archaeological Resources Protection Act of 1979 and misuse of this information is a violation of this act and

Welcome to the New ArchSite

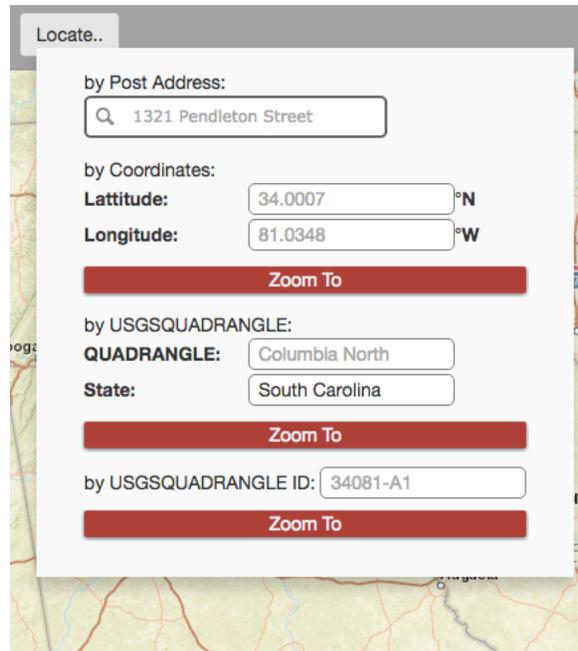

A map, like the one below should appear. The tool bar on the left is where you access most of the functions of ArchSite. Many tools will open new panels on the right side or bottom left of the map.

- **Zoom In / Zoom Out.** Use these two buttons to zoom in or out on the map. If your mouse has a scroll wheel, it will accomplish the same thing.
- **Default Extent.** Returns the map to its initial scale, showing the full state of South Carolina.
- **Find My Location.** Uses any GPS capabilities your device may possess to quickly zoom in to your current location.
- **Find Features.** Lets you search an area in the map layers or for contents of any attribute fields. It also opens in a panel on the right.
- **Data Export.** Allows you to export data in Shapefile, CSV, File Geodatabase, or KML formats. From a panel on the bottom left, you can delimit an area and the feature layers you are interested in and export them.
- **Basemaps.** Allows you to choose another basemap. The choices are displayed in a small panel on the bottom left.
- **Map Legend.** Provides a legend, on the bottom left, for the sites displayed. The legend shows only the items toggled on in the Map Layers.
- **Map Layers.** Opens a panel on the bottom left that allows you to toggle various feature layers on and off. Note that you must be sufficiently zoomed in before features will display.
- **Measure.** Allows you to get the coordinates for points, the length of lines, and the area of regions you mark.
- **Print.** Creates a printable file of what is on the screen.

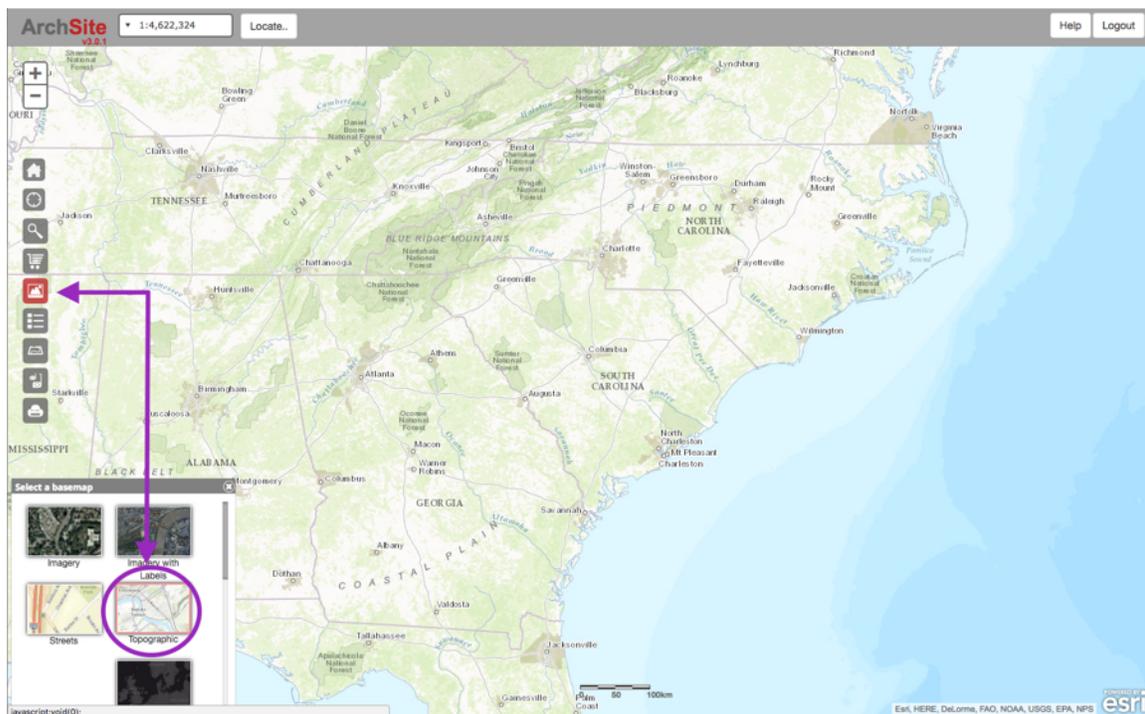

You can use the fields in the site's title bar to change the map's scale, zoom to a location, access help, and log out of the site.

The title bar's Locate field will open up a dialog box that will let you zoom to a specific address, latitude and longitude, or USGS Quadrangle.

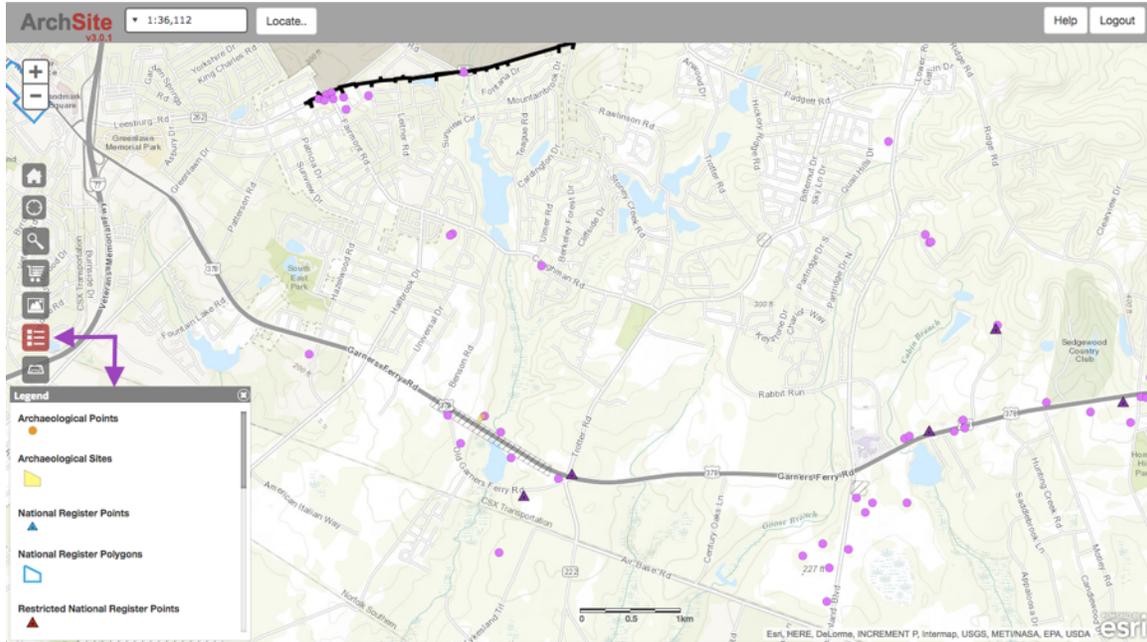

Changing the Map Display

The default map view is the "Streets" map. Clicking on the Basemap icon, will bring up a panel in the lower left where you can change the basemap used. Here I've switched to a topographic basemap.

Viewing the Map

At the initial scale, none of the ArchSite features are visible. Once you zoom in sufficiently — to at least a scale of 1:288,895 — the feature layers will begin to display. Clicking on the Legend icon in the tool bar will help you to identify the kinds of features displayed.

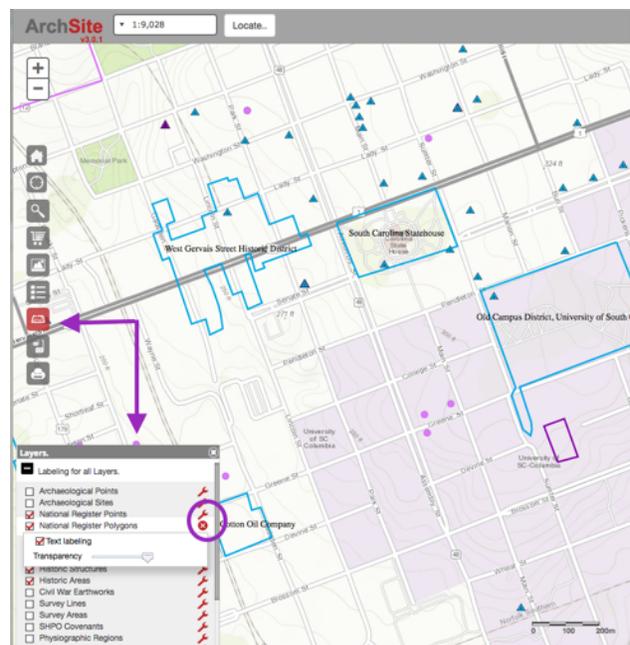

Changing the Visible Layers

Clicking on the Map Layers icon in the tool bar will allow you to select which feature layers are shown. This can make it easier to identify the features you are interested in.

The Map Layers panel will also let you turn on labels for all visible layers by checking the box at the top of the panel.

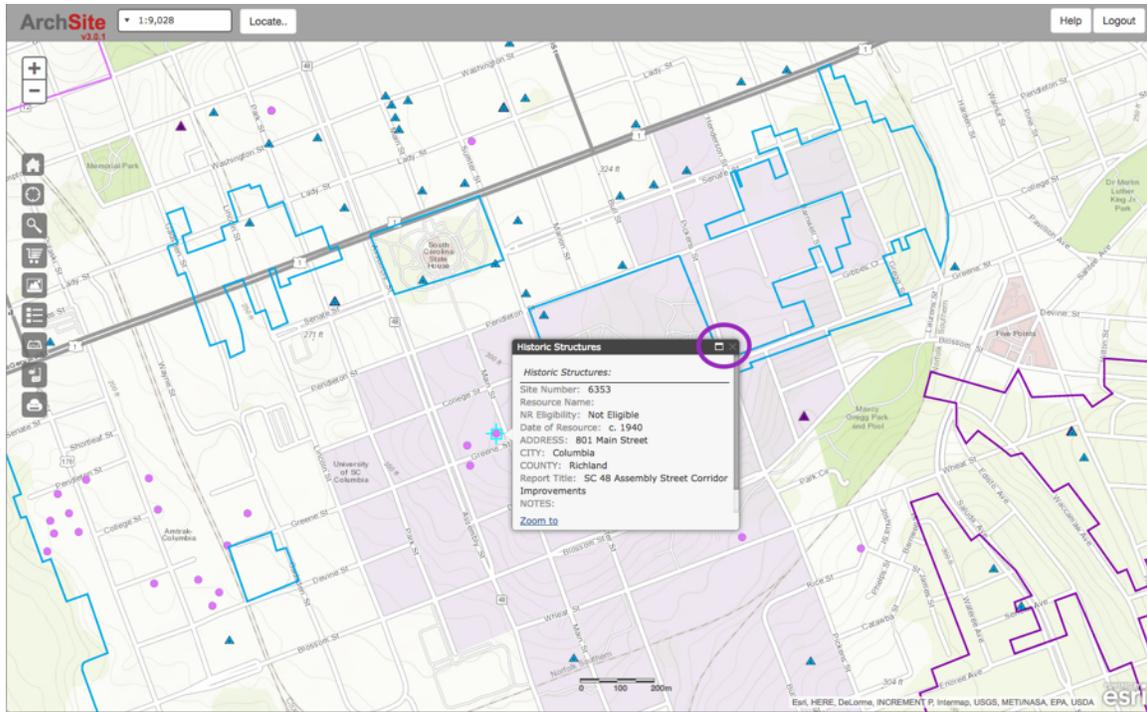

Clicking on the tool icon to the right of any visible layer will let you turn on the labels for a particular category of layers, as well as adjust the transparency of the markers.

Any changes you make in the Map Layers tool will be reflected in what you now see in the Map Legend.

Viewing Individual Features

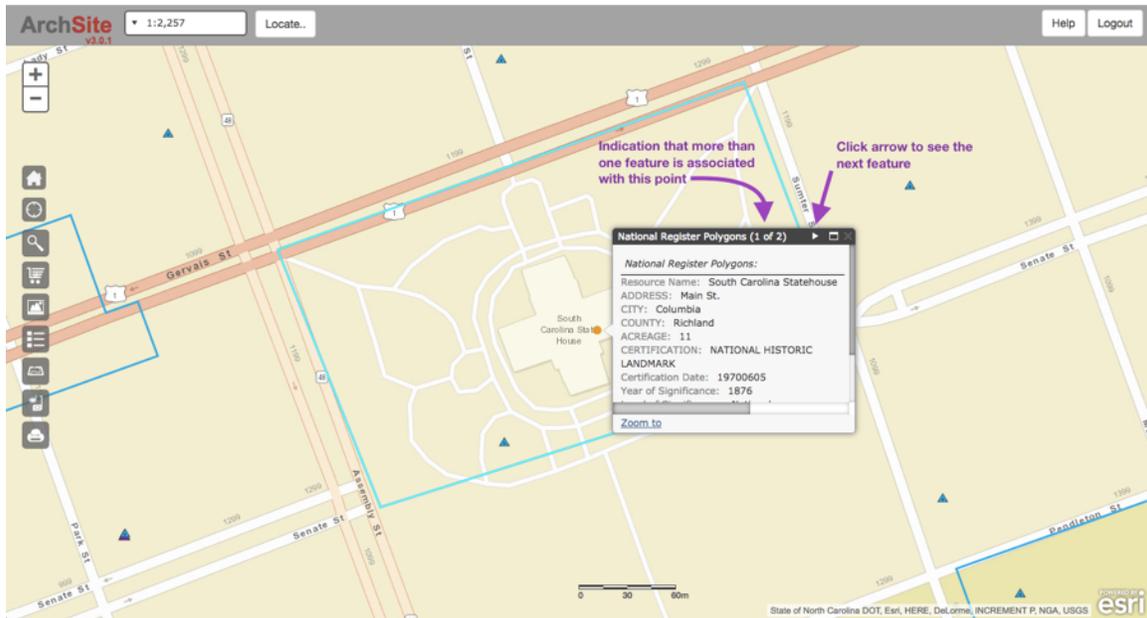

Clicking on any feature marker on the map will bring up a panel showing the data associated with the feature.

The full screen icon in the panel's top bar will maximize the size of the panel, which may make it easier to read. You can dismiss either panel (large or small) by clicking the "X" in the panel's upper right corner.

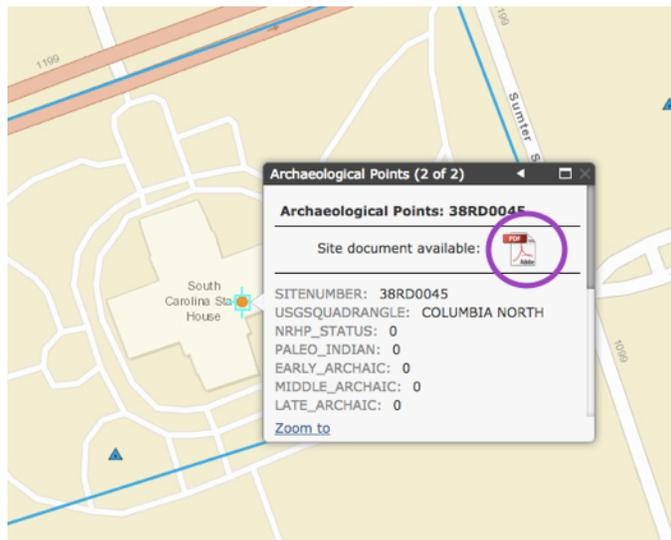

Points may be associated with more than one feature. The title bar of the panel will indicate if that is the case. For example, clicking on the point on the capitol will bring up data on the National Register Polygon (shown by the blue outline) whose associated data is visible in the box that pops up *and* an Archaeological Point (the golden dot).

To access data for the second feature, click on the arrow in the box's title bar.

For some archaeological features, there is an associated file. Clicking on the PDF icon will open that file in a new tab.

Using the Export Data Tool

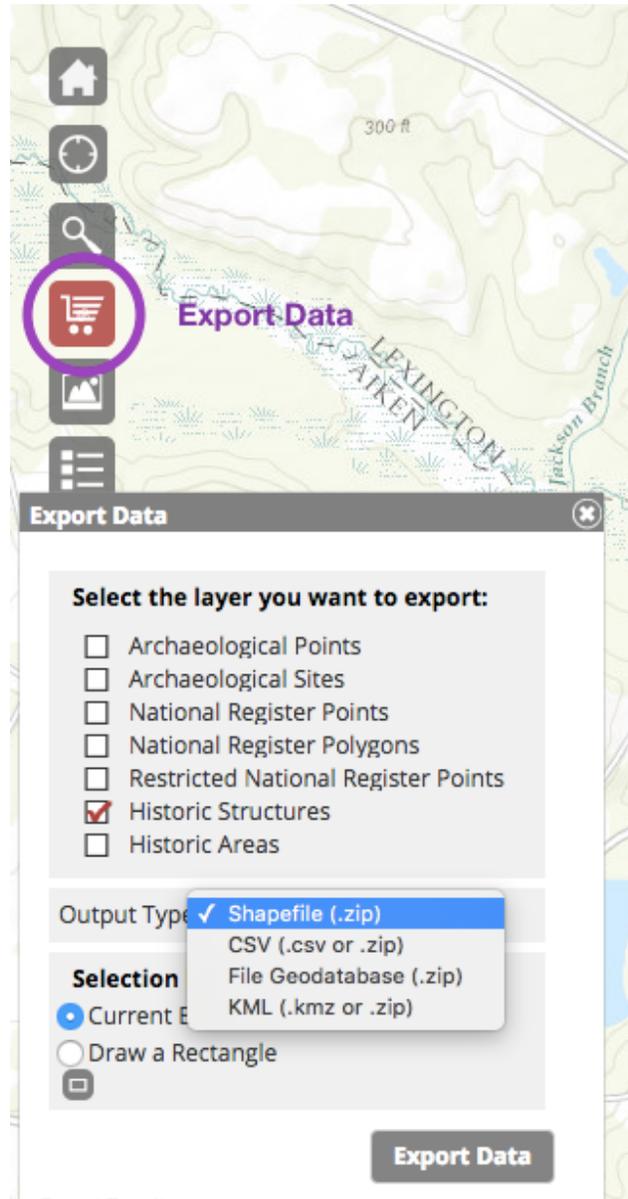

You can export data from this map in several formats: Shapefile (.zip), CSV (.csv or .zip), File Geodatabase (.zip), or as KML (.kmz or .zip).

Click the Export Data icon in the toolbar to open a panel on the bottom left.

There you can select the layer you want to export (you can currently only export one layer at a time), as well as the output type.

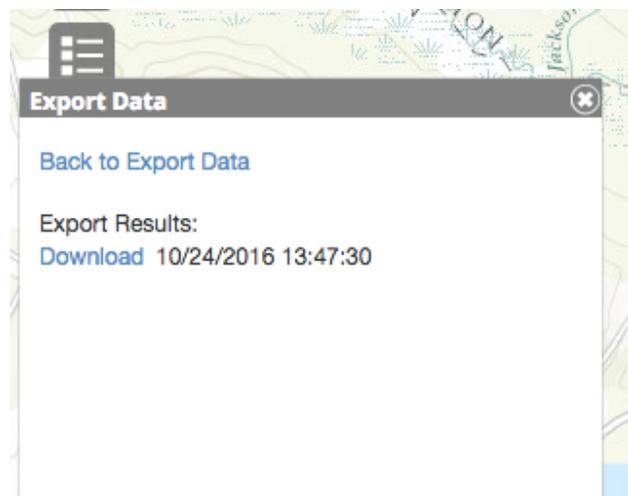

Select how much of the current screen you want to export: either the screen currently visible or you can draw a rectangle around a specific area you want to export.

Click the Export Data button.

When your map is ready, you will see a Download link below Export Results. Clicking it will download the file to wherever your browser has been set to download files.

After downloading the file, you can click the Back to Export Data link if you want to export other features. Or simply close the panel if you have the data you want.

Performing a Search

Click on the Find Features icon in the tool bar to bring up a panel (on the right) that allows you to search the map. You can search an area you define or you can search by specific attributes (address, site number, acreage, etc.) of a feature.

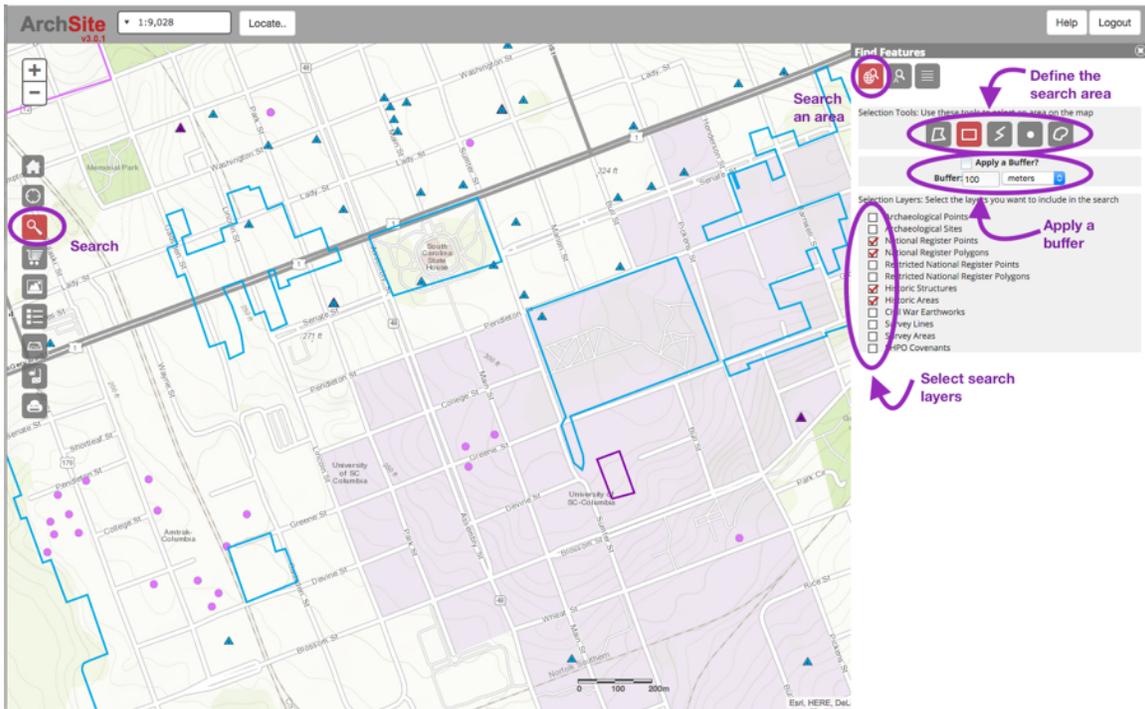

Searching an Area

Make sure the first icon is selected in the panel to search an area. Select the shape of the area you want to mark off. You may choose either

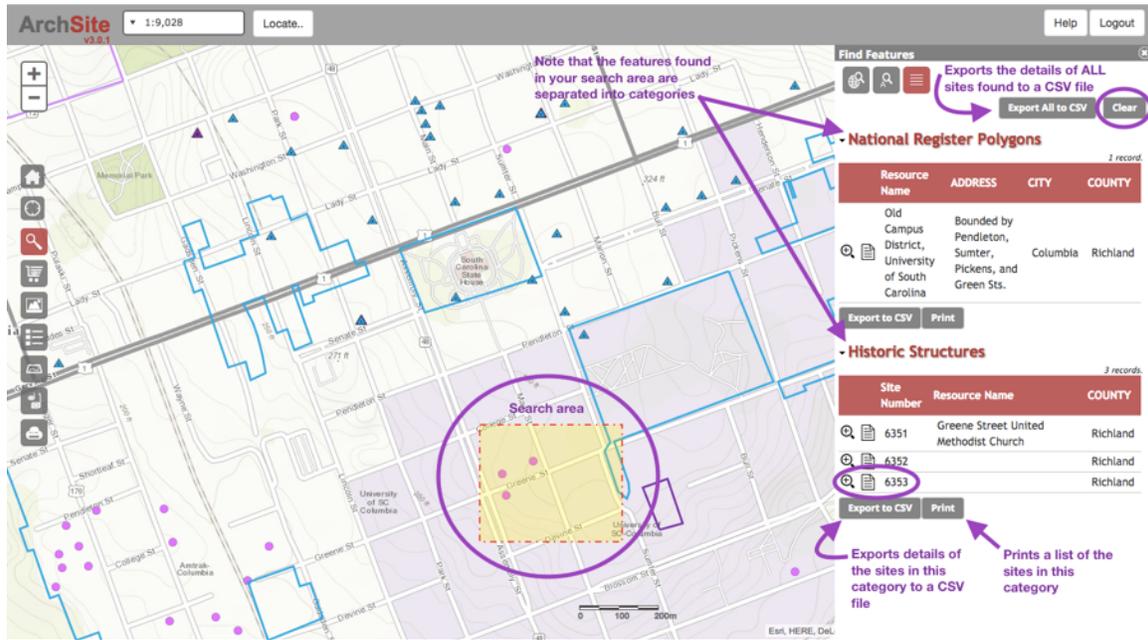

- a (straight-sided) polygon,
- a rectangle (extent),
- a line,
- a point, or
- an irregular shape.

Use your mouse to draw the shape on the map.

You can also include a buffer (measured in meters, kilometers, feet, or miles) around the area you designate. And you can limit your search to particular layers.

Once you've drawn your search area on the map, a list of the features within it should show up in the panel. They will be divided into categories by feature type. You may need to scroll to see everything found.

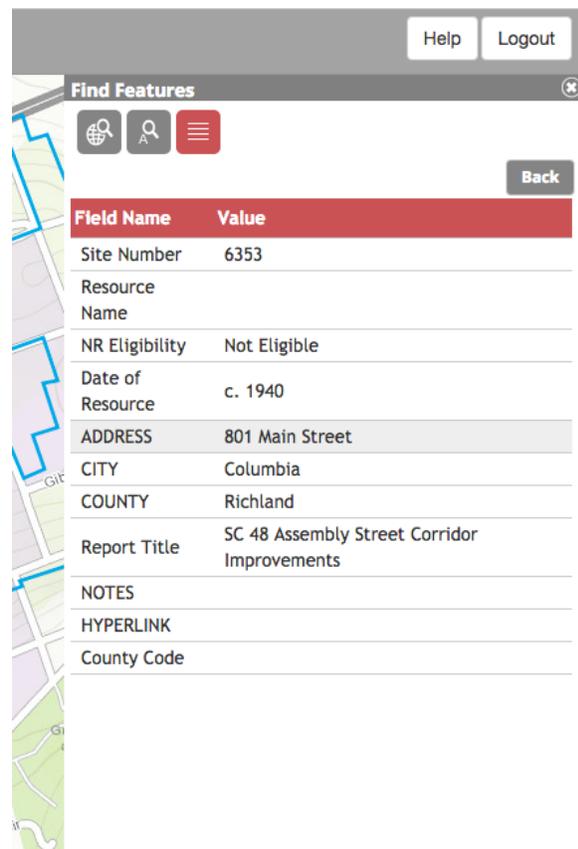

Clicking on the zoom icon (magnifying glass) for any site will zoom the map to that site.

Clicking on the Details icon (page image) will bring up detailed information for the site — like that to the right. Note that this is the same information that pops up when you click on any feature.

The Back button will take you back to the search results.

From the search results panel, you can export a CSV file of the information for sites in your search area by category (use the button under each category) — or you can export all of the sites in all the categories at once by clicking the Export All to CSV button near the top of the panel.

The Print button under each category prints the list of sites in that category — not a detailed list of their attributes.

Searching by Identifying Information

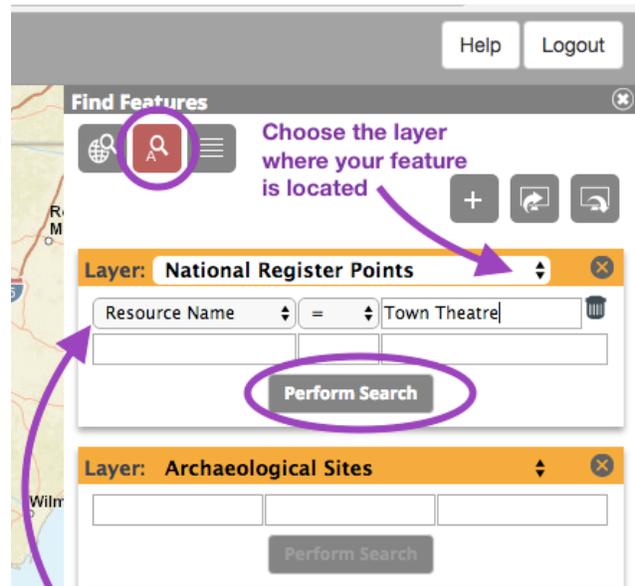

Make sure the second icon is selected in the panel to search by an identifier.

Select the appropriate layer from the Layer dropdown.

Beneath that, select the appropriate attribute label from the dropdown menu, how it is to be matched (equal to [=] is the default but you can do other kinds of searches), and then type in the identifier.

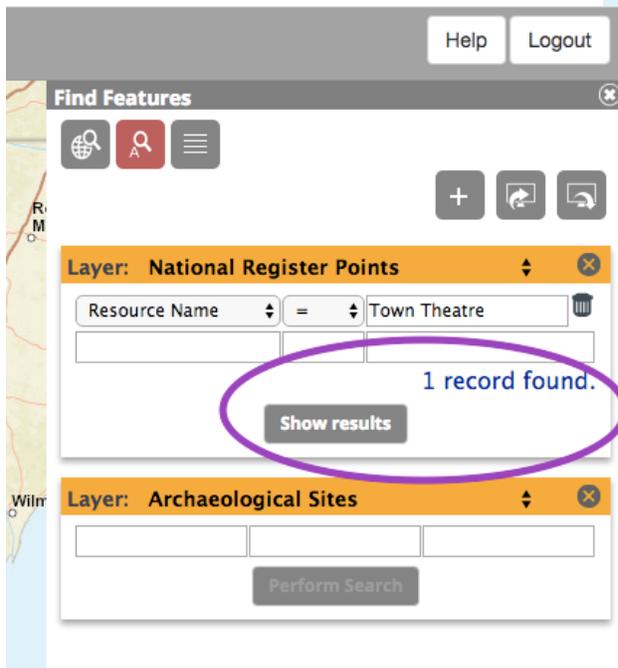

Note that you can add multiple search attributes.

When you are ready, click the Perform Search button.

Select an identifier label and type in your identifier

Click the Perform Search button

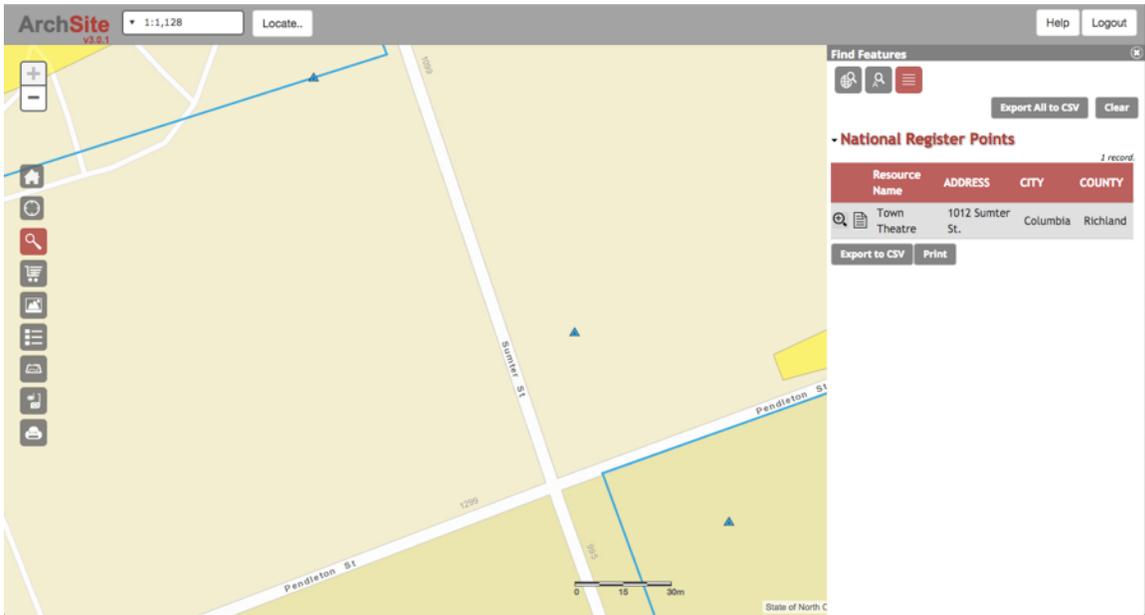

In the panel you will be able to see if there were any matches.

Click the Show Results button to see more information on the item(s) found.

You might see something like the image below. Clicking on the zoom icon (the magnifying glass) will ensure that the feature shows up in the middle of the map; clicking on the details icon (the page image) will bring up information for that feature in the panel.

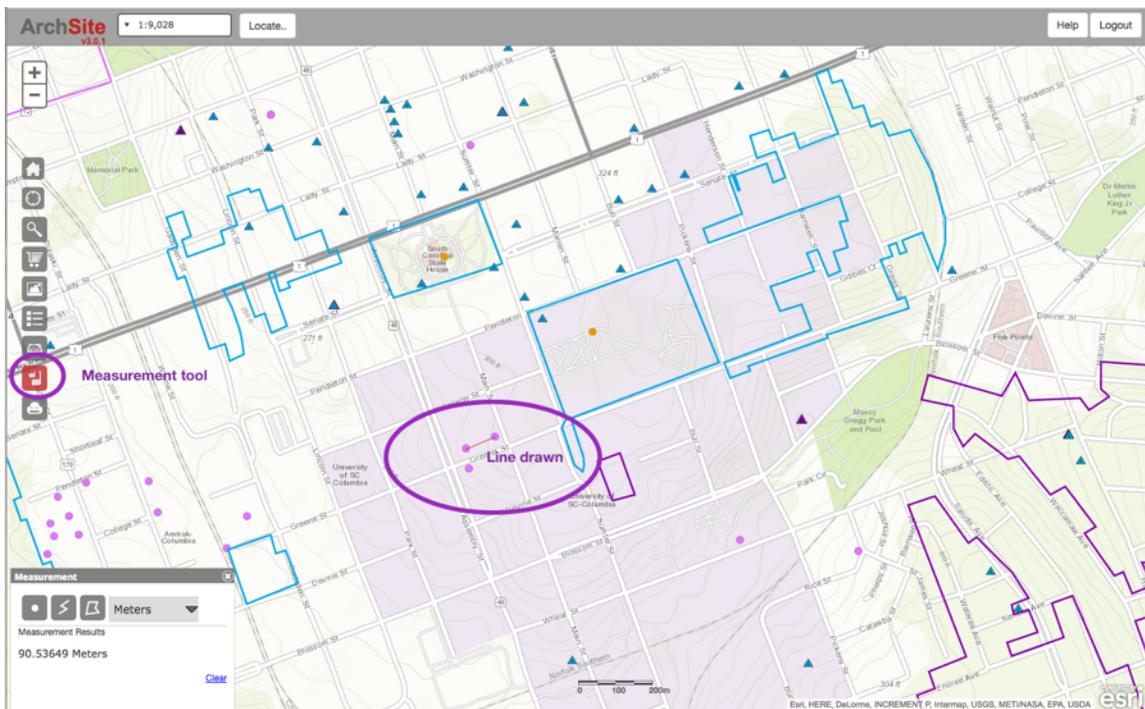

You again have the option to print your results and/or export the details as a CSV file.

Using the Measure Tool

Click on the Measure icon to bring up a panel on the bottom left. Selecting the point will give you the UTM coordinates; selecting the line or polygon shapes will let you draw on the map and determine the length or volume of your shape.

The dropdown menu will let you select the measurement units. Below, the line drawn between the two features is 90.53649 meters long.

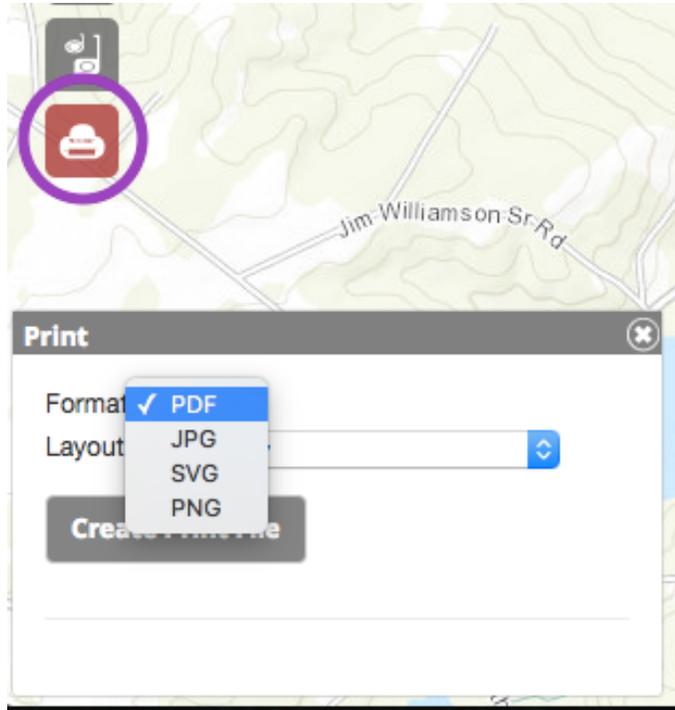

Using the Print Tool

Click on the Print icon to bring up a panel on the bottom left of the screen.

You may choose among several formats to create your map: PDF (the default format), JPG, SVG, or PNG

You may also choose a layout style. If you select any of the letter- or tabloid-sized, you will also be given an opportunity to title for the map.

Click the Create Print File button. Creating the file may take a while. Be patient.

When the print file is ready, you will see a Download link at the bottom of the panel. Clicking it will open your map in a new tab. From there you can print it and/or save it to your device.
